equations and the
existence problem for the
minimal two-sphere In
differential geometry,
Yamabe–Witten
equations are a family of
PDEs. They arise in
physics as equations of
motion of the dilaton and
graviton in string theory.
They describe a
conformal degree of

freedom of a conformally invariant field theory. The equations are named after Masao Yamabe and David Witten.

Degenerate
Yamabe–Witten
equations

Yamabe–Witten equations are defined for the following case: Let and be an n -dimensional manifold and a differentiable compactly

supported function on. is called the Witten–Yamabe conformal factor, where is the scalar curvature.

The Witten–Yamabe conformal transformation of the metric is given by where is the volume element. The conformal factor (also called the conformal factor of the conformally invariant field theory) is now

defined as: The following are the Yamabe–Witten equations: Yamabe classification Yamabe classification states that there are only three possibilities for a given manifold: The first is the Yamabe I case. There exists a conformal factor so that the scalar curvature and the covariant Laplacian. The Yamabe–Witten

equations are solvable.

The second is the Yamabe II case. There is no conformal factor so that the scalar curvature and the covariant Laplacian. The Yamabe-Witten equations are not solvable. The last is the zero case. The Witten-Yamabe conformal factor vanishes. The zero case

is not physically significant since there is no conformal invariant field theory with degrees of freedom that is describable by a massless graviton and a scalar field. References

In 2017 a group of students started working on a game for the Windows Phone. In this game the player has to take control of a baby, who has to learn how to grow and mature. The more it learns the more it starts to grow. He has to learn to climb, jump, walk and run.
